

# Email Object

## *The fastest, easiest way to verify email addresses*

Verify, correct, and standardize email addresses in batch or at point of entry to ensure efficient delivery. Email Object can verify addresses in databases, address books, spreadsheets, or any other mailing list you have. You can also use the Email Object to verify email addresses as they are entered on your webforms.

### Your essential tool for email list hygiene

Email Object assures that only legitimate email addresses are saved and stored in your contact database. It will check every email address from a given mailing list and determine if emails are valid. It is an easy-to-use, powerful, and customizable tool to verify, correct, and clean up your mailing list. It performs three levels of verification: Syntax, Local Database, and MXlookup.

Save time and money, whether you send newsletters to your clients, bulletins to your members, or you just need to maintain a clean email contact list for effective communication. There is no need to disturb your clients and consumers to check if their email addresses are still valid. Email Object connects directly to their SMTP server and checks it for you. And, nothing is sent to the recipient.

Stop spending endless hours trying to find accurate, deliverable email addresses. Email Object affords you the flexibility and power you need to quickly and efficiently:

- Check for general format syntax errors
- Check for domain name changes
- Check for and correct top level domain name (TLD)
- Ensure addresses use a valid top level domain
- Detect improper email address format for common domains (ie:Hotmail, AOL, Yahoo) Validate domain name against a database of known good & bad addresses
- Verify whether the domain name exists through the MaileXchange (MX) Lookup for realtime feedback
- Parse email addresses into various components

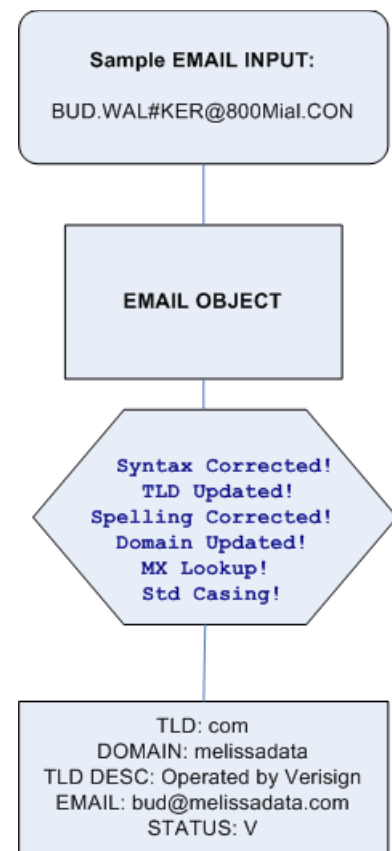

**Requirements:** 32 MB of hard disk space • 256 MB RAM Minimum • Multi-platform

### Benefits you can measure

- Improve email communication performance
- Increase response rates
- Avoid bounce-back and undeliverable emails
- Reduce online purchasing fraud and charge backs
- Eliminate the clutter of bad email addresses in your files

### Customize Email Object to your needs...

1. Customize, add domain name, & specify spelling fixes
2. Select level of corrections
3. Standardize casing of email addresses
4. Check for the existence of the mail server
5. Specify invalid domain names for suppression

### Features:

- Validates in batch or at point of entry
- Can verify 2 million records per hour
- An integral part of the DQT Suite
- Available for Windows & UNIX
- Free trial version available
